Compactness for a given property: for a mathematical structure, if the given property holds in every small substructure, then it holds in the structure.

Compactness for a given property: for a mathematical structure, if the given property holds in every small substructure, then it holds in the structure. When the infinitary logic is concerned under this particular circumstance we can define a strongly compact cardinal as follows:

### Definition (Tarski)

We say an uncountable  $\kappa$  is strongly compact iff it is the compactness number for  $\mathcal{L}_{\kappa\kappa}$

Compactness for a given property: for a mathematical structure, if the given property holds in every small substructure, then it holds in the structure. When the infinitary logic is concerned under this particular circumstance we can define a strongly compact cardinal as follows:

### Definition (Tarski)

We say an uncountable  $\kappa$  is strongly compact iff it is the compactness number for  $\mathcal{L}_{\kappa\kappa}$

Beyond countable level, many known compactness properties have large cardinal flavors

Compactness for a given property: for a mathematical structure, if the given property holds in every small substructure, then it holds in the structure. When the infinitary logic is concerned under this particular circumstance we can define a strongly compact cardinal as follows:

### Definition (Tarski)

We say an uncountable  $\kappa$  is strongly compact iff it is the compactness number for  $\mathcal{L}_{\kappa\kappa}$

Beyond countable level, many known compactness properties have large cardinal flavors but they usually follow from strong compactness.

Bagaria and Magidor generalized strong compactness to  $\delta$ -strong compactness for every  $\delta$  (weaker than strong compactness), which is enough to show many of these compactness properties.

Bagaria and Magidor generalized strong compactness to  $\delta$ -strong compactness for every  $\delta$  (weaker than strong compactness), which is enough to show many of these compactness properties.

### Definition (Bagaria-Magidor,2014)

Suppose  $\kappa \geq \delta$  are uncountable cardinals,

- 1  $\kappa$  is  *$\delta$ -strongly compact* iff every  $\kappa$ -complete filter over  $X$  can be extended to a  $\delta$ -complete ultrafilter over  $X$ .
- 2  $\kappa$  is *almost strongly compact* iff for any uncountable cardinal  $\delta < \kappa$ ,  $\kappa$  is  $\delta$ -strongly compact.

Bagaria and Magidor generalized strong compactness to  $\delta$ -strong compactness for every  $\delta$  (weaker than strong compactness), which is enough to show many of these compactness properties.

### Definition (Bagaria-Magidor,2014)

Suppose  $\kappa \geq \delta$  are uncountable cardinals,

- 1  $\kappa$  is  $\delta$ -strongly compact iff every  $\kappa$ -complete filter over  $X$  can be extended to a  $\delta$ -complete ultrafilter over  $X$ .
- 2  $\kappa$  is almost strongly compact iff for any uncountable cardinal  $\delta < \kappa$ ,  $\kappa$  is  $\delta$ -strongly compact.

Note that  $\kappa$  is  $\kappa$ -strongly compact iff  $\kappa$  is strongly compact, and if a cardinal is greater than the least  $\delta$ -strongly compact cardinal, then it is also  $\delta$ -strongly compact.

## what does $\omega_1$ -strong compactness grant us

The first fact (which is frequently used in showing more sophisticated results) is that  $\omega_1$ -strong compactness implies SCH above it, in another word Solovay's theorem for strongly compact can be generalized to  $\delta$ -strong compactness.

## what does $\omega_1$ -strong compactness grant us

The first fact (which is frequently used in showing more sophisticated results) is that  $\omega_1$ -strong compactness implies SCH above it, in another word Solovay's theorem for strongly compact can be generalized to  $\delta$ -strong compactness. Using this, Goldberg proved that the following Conjecture of Woodin holds.

### Theorem (Goldberg,2021)

*Any two elementary embeddings from the universe into the same inner model agree on the ordinals.*

# what does $\omega_1$ -strong compactness grant us

$\omega_1$ -strong compactness implies Woodin's HOD Dichotomy.

Theorem (Goldberg, 2021)

*Suppose  $\kappa$  is  $\omega_1$ -strongly compact. Then either all sufficiently large regular cardinals are measurable in HOD or every singular cardinal  $\lambda$  greater than  $\kappa$  is singular in HOD and  $\lambda^{\text{HOD}} = \lambda^+$ .*

Measurable cardinal,  $\delta$ -strongly compact cardinal, almost strongly compact cardinal and strongly compact cardinal forms a linear hierarchy.

$\delta$ -strong compactness can be reformulated in the way that strong compactness does.

$\delta$ -strong compactness can be reformulated in the way that strong compactness does.

## Proposition

*Suppose  $\kappa \geq \delta$  are uncountable cardinals. Then the following are equivalent:*

- 1**  $\kappa$  is  $\delta$ -strongly compact.
- 2** For any  $\lambda > \kappa$ , there exists an elementary embedding  $j : V \rightarrow M$  with  $M$  transitive and  $\text{crit}(j) \geq \delta$ , such that there exists a  $D \in M$  with  $j''\lambda \subseteq D$  and  $M \models |D| < j(\kappa)$ .
- 3** For every regular  $\lambda$ , there exists a  $\delta$ -complete uniform ultrafilter over  $\lambda$ .

## Question

*If  $K$  is the least  $\omega_1$ -strongly compact, is it necessarily strongly compact?*

Suppose that  $\theta$  is the first measurable cardinal, then  $\kappa$  is  $\omega_1$ -strongly compact iff  $\kappa$  is  $\theta$ -strongly compact.

Suppose that  $\theta$  is the first measurable cardinal, then  $\kappa$  is  $\omega_1$ -strongly compact iff  $\kappa$  is  $\theta$ -strongly compact.

By a result of Magidor, the least measurable cardinal may be strongly compact, thus the least  $\omega_1$ -strongly compact may be strongly compact.

## Theorem (Bagaria-Magidor,2014)

*Assume  $\kappa$  is a supercompact cardinal, and  $\delta < \kappa$  is a measurable cardinal. Then after a suitable Radin forcing,  $\kappa$  is the least  $\delta$ -strongly compact cardinal and has cofinality  $\delta$ . Hence  $\kappa$  is not strongly compact cardinal.*

# Almost strong compactness v.s. strong compactness

In contrast, evidently, almost strong compactness and strong compactness are quite close to each other.

# Almost strong compactness v.s. strong compactness

In contrast, evidently, almost strong compactness and strong compactness are quite close to each other.

## Theorem (Menas, 1974)

*If the least almost strongly compact cardinal is measurable, then it is strongly compact.*

## Theorem (Goldberg,2020)

*Assume SCH holds. Suppose  $\kappa$  is an almost strongly compact cardinal of uncountable cofinality. Then one of the following holds:*

- 1**  *$\kappa$  is a strongly compact cardinal.*
- 2**  *$\kappa$  is the successor of a strongly compact cardinal.*
- 3**  *$\kappa$  is a limit of almost strongly compact cardinals.*

## Theorem (Goldberg,2020)

*Assume SCH holds. Suppose  $\kappa$  is an almost strongly compact cardinal of uncountable cofinality. Then one of the following holds:*

- 1**  *$\kappa$  is a strongly compact cardinal.*
- 2**  *$\kappa$  is the successor of a strongly compact cardinal.*
- 3**  *$\kappa$  is a limit of almost strongly compact cardinals.*

## Corollary (Goldberg,2020)

*Assume SCH holds. If the least almost strongly compact has uncountable cofinality, then it is strongly compact.*

# Almost strong compactness v.s. strong compactness

As we can see, there are some subtleties lying between almost strong compactness and strong compactness.

# Almost strong compactness v.s. strong compactness

As we can see, there are some subtleties lying between almost strong compactness and strong compactness.

## Question (Boney and Brooke-Taylor)

*Is the least almost strongly compact cardinal necessarily strongly compact?*

It turns out that Goldberg's theorem no longer holds when the cofinality assumption is dropped.

### Theorem (You-Yuan)

*Consistently (relative to suitable large cardinal assumptions) the least almost strongly compact cardinal, can be of cofinality  $\omega$ , and thus it is not necessarily strongly compact*

To achieve this (showing that we can have a model which has a least almost strongly compact cardinal with cofinality  $\omega$ ), we need a positive answer to the following question of Bagaria-Magidor:

To achieve this (showing that we can have a model which has a least almost strongly compact cardinal with cofinality  $\omega$ ), we need a positive answer to the following question of Bagaria-Magidor:

### Question (Bagaria, Magidor)

*Is there a class (possibly proper)  $\mathcal{K}$  with  $|\mathcal{K}| \geq 2$ , and a  $\delta_\kappa < \kappa$  for every  $\kappa \in \mathcal{K}$ , so that  $\kappa$  is the least exactly  $\delta_\kappa$ -strongly compact cardinal for every  $\kappa \in \mathcal{K}$ ?*

To achieve this (showing that we can have a model which has a least almost strongly compact cardinal with cofinality  $\omega$ ), we need a positive answer to the following question of Bagaria-Magidor:

### Question (Bagaria, Magidor)

*Is there a class (possibly proper)  $\mathcal{K}$  with  $|\mathcal{K}| \geq 2$ , and a  $\delta_\kappa < \kappa$  for every  $\kappa \in \mathcal{K}$ , so that  $\kappa$  is the least exactly  $\delta_\kappa$ -strongly compact cardinal for every  $\kappa \in \mathcal{K}$ ?*

This is because by a theorem of B-M if  $\kappa$  is the least  $\delta < \kappa$  strongly compact then the cofinality of  $\kappa$  has to be strictly larger than  $\delta$  and thus uncountable.

To achieve this (showing that we can have a model which has a least almost strongly compact cardinal with cofinality  $\omega$ ), we need a positive answer to the following question of Bagaria-Magidor:

### Question (Bagaria, Magidor)

*Is there a class (possibly proper)  $\mathcal{K}$  with  $|\mathcal{K}| \geq 2$ , and a  $\delta_\kappa < \kappa$  for every  $\kappa \in \mathcal{K}$ , so that  $\kappa$  is the least exactly  $\delta_\kappa$ -strongly compact cardinal for every  $\kappa \in \mathcal{K}$ ?*

This is because by a theorem of B-M if  $\kappa$  is the least  $\delta < \kappa$  strongly compact then the cofinality of  $\kappa$  has to be strictly larger than  $\delta$  and thus uncountable.

If there is a  $\mathcal{K}$  of size  $\omega$  with  $\sup_{\kappa \in \mathcal{K}}(\delta_\kappa) = \sup(\mathcal{K})$ , then  $\sup(\mathcal{K})$  is an almost strongly compact cardinal with SCH holds from below.

## Fact

*If  $\kappa$  is  $\delta$ -strongly compact, then for every regular  $\lambda \geq \kappa$ , every stationary subset  $S \subseteq E_{<\delta}^\lambda = \{\alpha < \lambda \mid \text{cf}(\alpha) < \delta\}$  reflects.*

## Fact

*If  $\kappa$  is  $\delta$ -strongly compact, then for every regular  $\lambda \geq \kappa$ , every stationary subset  $S \subseteq E_{<\delta}^\lambda = \{\alpha < \lambda \mid \text{cf}(\alpha) < \delta\}$  reflects.*

## Proof.

Let  $j : V \rightarrow M$  be an ultrapower map given by a  $\delta$ -complete ultrafilter over  $\mathcal{P}_\kappa(\lambda)$ .

Let  $\beta := \sup(j''\lambda)$  and  $T := j(S) \cap \beta$ . Then  $j''S \subseteq T$ .

Meanwhile, for every club  $C$  of  $\beta$  in  $M$ , let  $D := j^{-1}[C]$ . Then  $D$  is a  $< \delta$ -club. So there is some  $\alpha \in D \cap S \neq \emptyset$ . Thus  $j(\alpha) \in C \cap j(S) \subseteq C \cap T$ . This means that  $M$  thinks that  $T$  is stationary.

By elementarity,  $S \cap \alpha$  is stationary for some  $\alpha < \lambda$  of uncountable cofinality. □

# Forcing $\mathbb{P}_i$

Gitik extended a basic idea of Kunen's construction of a model with a  $\kappa$ -saturated ideal over an inaccessible cardinal  $\kappa$ .

## Theorem (Gitik, 2020)

*Suppose  $\kappa$  is a supercompact cardinal,  $\delta < \kappa$  is a measurable cardinal. Then after a preparation forcing,  $\kappa$  may be the least  $\delta$ -strongly compact cardinal but not strongly compact after a forcing  $Q_{\kappa, \delta}$ .*

$\mathbb{P}_i$  is the iteration of the preparation forcing and  $Q_{\kappa, \delta}$ .

$Q_{\kappa, \delta}$ 

## Definition

Let  $\kappa > \delta$  be a 2-Mahlo cardinal, define a forcing notion  $Q_{\kappa, \delta}$  as follows:

$\langle T, \vec{f} \rangle \in Q_{\kappa, \delta}$  if

- 1  $T \subseteq {}^{<\kappa}2$  is a normal homogeneous tree of a successor height  $\text{ht}(T)$  below  $\kappa$ .
- 2  $\vec{f} = \langle f_\alpha \mid \alpha < \text{ht}(T) \rangle$  is a  $\delta$ -ascent path through  $T$ , i.e.,
  - 1  $\vec{f} = \langle f_\alpha \mid \alpha < \kappa, f_\alpha : \delta \rightarrow \text{Lev}_\alpha(T) \rangle$ .
  - 2 for every  $\alpha, \beta < \kappa$ , if  $\alpha < \beta$ , then the set  $\{\gamma < \delta \mid f_\alpha(\gamma) <_T f_\beta(\gamma)\}$  is co-bounded in  $\delta$ .

The order on  $Q_{\kappa, \delta}$  is defined by taking end extensions.

## Fact (Gitik,2020)

$Q_{\kappa,\delta}$  adds a pair  $\langle T, \vec{f} \rangle$ , where  $T$  is a  $\delta$ -ascent  $\kappa$ -Suslin tree, and the function sequence  $\vec{f}$  is a  $\delta$ -ascent path through  $T$ .

## Fact (Gitik,2020)

$Q_{\kappa,\delta}$  adds a pair  $\langle T, \vec{f} \rangle$ , where  $T$  is a  $\delta$ -ascent  $\kappa$ -Suslin tree, and the function sequence  $\vec{f}$  is a  $\delta$ -ascent path through  $T$ .

Let  $i : V \rightarrow M$  be the ultrapower map given by a normal measure  $U$  over  $\delta$ . We may lift  $i$  to  $i^+ : V^{Q_{\kappa,\delta}} \rightarrow M^{i(Q_{\kappa,\delta})}$  as  $Q_{\kappa,\delta}$  is  $< \kappa$ -strategically closed. Since  $T$  is a  $\kappa$ -Suslin tree,  $\kappa$  is not strongly compact in  $V^{Q_{\kappa,\delta}}$ .

## Fact (Gitik,2020)

$Q_{\kappa,\delta}$  adds a pair  $\langle T, \vec{f} \rangle$ , where  $T$  is a  $\delta$ -ascent  $\kappa$ -Suslin tree, and the function sequence  $\vec{f}$  is a  $\delta$ -ascent path through  $T$ .

Let  $i : V \rightarrow M$  be the ultrapower map given by a normal measure  $U$  over  $\delta$ . We may lift  $i$  to  $i^+ : V^{Q_{\kappa,\delta}} \rightarrow M^{i(Q_{\kappa,\delta})}$  as  $Q_{\kappa,\delta}$  is  $< \kappa$ -strategically closed. Since  $T$  is a  $\kappa$ -Suslin tree,  $\kappa$  is not strongly compact in  $V^{Q_{\kappa,\delta}}$ .

But  $\vec{f}$  is a  $\delta$ -ascent path through  $T$ , so  $\{[f_\alpha]_U \mid \alpha < \kappa\}$  generates a generic cofinal branch of  $i(T)$ , and the supercompactness of  $\kappa$  in  $M$  destroyed by  $i(Q_{\kappa,\delta})$  is resurrected by adding the generic cofinal branch.

## Lemma

*Let  $\kappa > \delta$  be regular cardinals.  $T$  is a  $\delta$ -ascent  $\kappa$ -Suslin tree witnessed by  $\vec{f}$ . Then there is no e.e.  $j : V \rightarrow M$  with  $\text{crit}(j) > \delta$  and  $\beta := \sup(j'' \kappa) < j(\kappa)$ .*

## Lemma

*Let  $\kappa > \delta$  be regular cardinals.  $T$  is a  $\delta$ -ascent  $\kappa$ -Suslin tree witnessed by  $\vec{f}$ . Then there is no e.e.  $j : V \rightarrow M$  with  $\text{crit}(j) > \delta$  and  $\beta := \sup(j''\kappa) < j(\kappa)$ .*

**Proof sketch:** If not, let  $j : V \rightarrow M$  be an elementary embedding with  $\text{crit}(j) > \delta$  and  $\beta := \sup(j''\kappa) < j(\kappa)$ .

## Lemma

*Let  $\kappa > \delta$  be regular cardinals.  $T$  is a  $\delta$ -ascent  $\kappa$ -Suslin tree witnessed by  $\vec{f}$ . Then there is no e.e.  $j : V \rightarrow M$  with  $\text{crit}(j) > \delta$  and  $\beta := \sup(j''\kappa) < j(\kappa)$ .*

**Proof sketch:** If not, let  $j : V \rightarrow M$  be an elementary embedding with  $\text{crit}(j) > \delta$  and  $\beta := \sup(j''\kappa) < j(\kappa)$ .

By elementarity and  $\text{crit}(j) > \delta$ , for any  $\alpha < \kappa$ ,  
 $\{\gamma < \delta \mid j(\vec{f})_\alpha(\gamma) <_{j(T)} j(\vec{f})_\beta(\gamma)\}$  is co-bounded.

## Lemma

Let  $\kappa > \delta$  be regular cardinals.  $T$  is a  $\delta$ -ascent  $\kappa$ -Suslin tree witnessed by  $\vec{f}$ . Then there is no e.e.  $j : V \rightarrow M$  with  $\text{crit}(j) > \delta$  and  $\beta := \sup(j''\kappa) < j(\kappa)$ .

**Proof sketch:** If not, let  $j : V \rightarrow M$  be an elementary embedding with  $\text{crit}(j) > \delta$  and  $\beta := \sup(j''\kappa) < j(\kappa)$ .

By elementarity and  $\text{crit}(j) > \delta$ , for any  $\alpha < \kappa$ ,

$\{\gamma < \delta \mid j(\vec{f})_\alpha(\gamma) <_{j(T)} j(\vec{f})_\beta(\gamma)\}$  is co-bounded.

Since  $\beta$  has cofinality  $\kappa > \delta$ , there exists a  $\delta' < \delta$  and an unbounded  $A \subseteq \kappa$ , such that for any  $\alpha \in A$ , we have for any  $\delta' \leq \gamma < \delta$ ,

$$j(\vec{f})_\alpha(\gamma) <_{j(T)} j(\vec{f})_\beta(\gamma).$$

## Lemma

*Let  $\kappa > \delta$  be regular cardinals.  $T$  is a  $\delta$ -ascent  $\kappa$ -Suslin tree witnessed by  $\vec{f}$ . Then there is no e.e.  $j : V \rightarrow M$  with  $\text{crit}(j) > \delta$  and  $\beta := \sup(j''\kappa) < j(\kappa)$ .*

**Proof sketch:** If not, let  $j : V \rightarrow M$  be an elementary embedding with  $\text{crit}(j) > \delta$  and  $\beta := \sup(j''\kappa) < j(\kappa)$ .

By elementarity and  $\text{crit}(j) > \delta$ , for any  $\alpha < \kappa$ ,

$\{\gamma < \delta \mid j(\vec{f})_\alpha(\gamma) <_{j(T)} j(\vec{f})_\beta(\gamma)\}$  is co-bounded.

Since  $\beta$  has cofinality  $\kappa > \delta$ , there exists a  $\delta' < \delta$  and an unbounded  $A \subseteq \kappa$ , such that for any  $\alpha \in A$ , we have for any  $\delta' \leq \gamma < \delta$ ,

$j(\vec{f})_\alpha(\gamma) <_{j(T)} j(\vec{f})_\beta(\gamma)$ .

It's easy to see that  $\{\vec{f}_\alpha(\delta') \mid \alpha \in A\}$  generates a cofinal branch through  $T$ .

## Lemma

Let  $\kappa > \delta$  be regular cardinals.  $T$  is a  $\delta$ -ascent  $\kappa$ -Suslin tree witnessed by  $\vec{f}$ . Then there is no e.e.  $j : V \rightarrow M$  with  $\text{crit}(j) > \delta$  and  $\beta := \sup(j''\kappa) < j(\kappa)$ .

**Proof sketch:** If not, let  $j : V \rightarrow M$  be an elementary embedding with  $\text{crit}(j) > \delta$  and  $\beta := \sup(j''\kappa) < j(\kappa)$ .

By elementarity and  $\text{crit}(j) > \delta$ , for any  $\alpha < \kappa$ ,

$\{\gamma < \delta \mid j(\vec{f})_\alpha(\gamma) <_{j(T)} j(\vec{f})_\beta(\gamma)\}$  is co-bounded.

Since  $\beta$  has cofinality  $\kappa > \delta$ , there exists a  $\delta' < \delta$  and an unbounded  $A \subseteq \kappa$ , such that for any  $\alpha \in A$ , we have for any  $\delta' \leq \gamma < \delta$ ,

$j(\vec{f})_\alpha(\gamma) <_{j(T)} j(\vec{f})_\beta(\gamma)$ .

It's easy to see that  $\{\vec{f}_\alpha(\delta') \mid \alpha \in A\}$  generates a cofinal branch through  $T$ .

Hence in Gitik's model,  $\kappa$  is exactly  $\delta$ -strongly compact.

# Main idea

Assume  $\langle \kappa_i \mid i < \omega \rangle$  is an increasing sequence of supercompact cardinals, and let  $\kappa = \lim_{i < \omega} \kappa_i$ .

Let  $\langle \delta_i \mid i < \omega \rangle$  be an increasing sequence of measurable cardinals, such that  $\delta_0 < \kappa_0$  and  $\kappa_{i-1} < \delta_i < \kappa_i$  for every  $0 < i < \omega$ .

# Main idea

Assume  $\langle \kappa_i \mid i < \omega \rangle$  is an increasing sequence of supercompact cardinals, and let  $\kappa = \lim_{i < \omega} \kappa_i$ .

Let  $\langle \delta_i \mid i < \omega \rangle$  be an increasing sequence of measurable cardinals, such that  $\delta_0 < \kappa_0$  and  $\kappa_{i-1} < \delta_i < \kappa_i$  for every  $0 < i < \omega$ .

We may find a nice forcing  $\mathbb{P}_i$  to make  $\kappa_i$  the least  $\delta_i$ -strongly compact cardinal.

# Main idea

Assume  $\langle \kappa_i \mid i < \omega \rangle$  is an increasing sequence of supercompact cardinals, and let  $\kappa = \lim_{i < \omega} \kappa_i$ .

Let  $\langle \delta_i \mid i < \omega \rangle$  be an increasing sequence of measurable cardinals, such that  $\delta_0 < \kappa_0$  and  $\kappa_{i-1} < \delta_i < \kappa_i$  for every  $0 < i < \omega$ .

We may find a nice forcing  $\mathbb{P}_i$  to make  $\kappa_i$  the least  $\delta_i$ -strongly compact cardinal.

Then take the product forcing  $\prod_{i < \omega} \mathbb{P}_i$ , we may make  $\kappa_i$  the least  $\delta_i$ -strongly compact cardinal for every  $i < \omega$ . Then  $\kappa$  may be the least almost strongly compact cardinal and has cofinality  $\omega$ . So  $\kappa$  is not strongly compact.

## Theorem (Laver, 1978)

*Suppose  $\kappa$  is supercompact. Then there is a forcing, say  $\mathbb{P}$ , so that in  $V^{\mathbb{P}}$ ,  $\kappa$  is still supercompact, and for any  $< \kappa$ -directed closed forcing  $\mathbb{Q}$ ,  $\kappa$  is also supercompact in  $V^{\mathbb{P} * \mathbb{Q}}$ .*

## Theorem (Laver, 1978)

*Suppose  $\kappa$  is supercompact. Then there is a forcing, say  $\mathbb{P}$ , so that in  $V^{\mathbb{P}}$ ,  $\kappa$  is still supercompact, and for any  $< \kappa$ -directed closed forcing  $\mathbb{Q}$ ,  $\kappa$  is also supercompact in  $V^{\mathbb{P} * \mathbb{Q}}$ .*

$Q_{\kappa, \delta}$  is  $< \delta$ -directed closed and  $< \kappa$ -strategically closed.

## Theorem (Laver, 1978)

*Suppose  $\kappa$  is supercompact. Then there is a forcing, say  $\mathbb{P}$ , so that in  $V^{\mathbb{P}}$ ,  $\kappa$  is still supercompact, and for any  $< \kappa$ -directed closed forcing  $\mathbb{Q}$ ,  $\kappa$  is also supercompact in  $V^{\mathbb{P} * \dot{\mathbb{Q}}}$ .*

$Q_{\kappa, \delta}$  is  $< \delta$ -directed closed and  $< \kappa$ -strategically closed.

We can turn many supercompact cardinal  $\kappa$  into non-strongly compact  $\delta$ -strongly compact cardinal at the same time by using the Eason-product of many  $Q_{\kappa, \delta}$ .

## Theorem (You-Yuan)

*Suppose  $\mathcal{K}$  is a class of supercompact cardinals containing none of its limit points, and  $\mathcal{A} = \langle \delta_\kappa \mid \kappa \in \mathcal{K} \rangle$  is an increasing sequence of measurable cardinals such that for any  $\kappa \in \mathcal{K}$ ,  $\delta_\kappa < \kappa$  and  $\sup(\mathcal{A} \cap \kappa) < \kappa$ . Then in some extension  $V^{\mathbb{P}}$ , for any  $\kappa \in \mathcal{K}$ ,  $\kappa$  is exactly  $\delta_\kappa$ -strongly compact cardinal. Moreover, if  $\sup(\mathcal{K} \cap \kappa) < \delta_\kappa$ , then  $\kappa$  is the least one. In addition, no new strongly compact cardinals are created.*

## Theorem (You-Yuan)

*Suppose  $\mathcal{K}$  is a class of supercompact cardinals containing none of its limit points, and  $\mathcal{A} = \langle \delta_\kappa \mid \kappa \in \mathcal{K} \rangle$  is an increasing sequence of measurable cardinals such that for any  $\kappa \in \mathcal{K}$ ,  $\delta_\kappa < \kappa$  and  $\sup(\mathcal{A} \cap \kappa) < \kappa$ . Then in some extension  $V^{\mathbb{P}}$ , for any  $\kappa \in \mathcal{K}$ ,  $\kappa$  is exactly  $\delta_\kappa$ -strongly compact cardinal. Moreover, if  $\sup(\mathcal{K} \cap \kappa) < \delta_\kappa$ , then  $\kappa$  is the least one. In addition, no new strongly compact cardinals are created.*

This gives an affirmative answer to Bagaria-Magidor's question.

## Corollary (You-Yuan)

*Suppose the class of supercompact cardinals  $\mathcal{K}$  has no measurable limit points, and for any  $\kappa \in \mathcal{K}$ ,  $\sup(\mathcal{K} \cap \kappa) < \delta_\kappa < \kappa$  is measurable. Then there is a forcing extension  $V^{\mathbb{P}}$ , in which for any  $\kappa \in \mathcal{K}$ ,  $\kappa$  is the least  $\delta_\kappa$ -strongly compact cardinal. In addition, there is no strongly compact cardinal in  $V^{\mathbb{P}}$ .*

## Corollary (You-Yuan)

*Suppose the class of supercompact cardinals  $\mathcal{K}$  has no measurable limit points, and for any  $\kappa \in \mathcal{K}$ ,  $\sup(\mathcal{K} \cap \kappa) < \delta_\kappa < \kappa$  is measurable. Then there is a forcing extension  $V^{\mathbb{P}}$ , in which for any  $\kappa \in \mathcal{K}$ ,  $\kappa$  is the least  $\delta_\kappa$ -strongly compact cardinal. In addition, there is no strongly compact cardinal in  $V^{\mathbb{P}}$ .*

The case that the order type of  $\mathcal{K}$  is  $\omega$  separates almost strong compactness from strong compactness, which gives a negative answer for the question of Boney and Brook Taylor.

## Question

*Is it consistent that there exists two singular cardinals  $\kappa_0 < \kappa_1$ , such that for  $i < 2$ ,  $\kappa_i$  is the least  $\delta_i$ -strongly compact cardinal for some  $\delta_i < \kappa_i$ ?*

## Question

*Is it consistent that there exists two singular cardinals  $\kappa_0 < \kappa_1$ , such that for  $i < 2$ ,  $\kappa_i$  is the least  $\delta_i$ -strongly compact cardinal for some  $\delta_i < \kappa_i$ ?*

## Question

*If the least almost strongly compact cardinal is regular, is it necessarily strongly compact?*
